

Business Problem:

ABC Telecom provides a wide range of services, including airtime top-ups, data bundles, mobile phone purchases, fiber internet, and more. Customers can conveniently purchase airtime or packages using their mobile money accounts, along with various other services.

However, new users and infrequent customers often struggle to navigate the available offers and remember the corresponding access codes. Additionally, customers waste valuable time navigating through multiple menus before reaching their desired offer.

To resolve this issue, a chatbot will be developed to assist users with:

- Finding contact numbers for ABC Telecom customer service agencies.
- Retrieving shortcodes to check their own phone number.
- Exploring available airtime and data packages.
- Exploring available offer.

This proposed solution aims to provide customers with quick access to essential services, eliminating the need to visit a physical service center and avoiding the time-consuming menu-by-menu navigation required to access an offer.
